

Course- BTech
Course Code- CSET101

Year- 2023
Date-

Type- Core
Course Name- Computational Thinking and Programming
Semester- odd
Batch- ALL

Tutorial Assignment: 11

Q1. Write a program to count the number of lines in files.

Q2. Write a program to check whether a string is present in a file.

Q3. Create a program to delete lines in a file.

Q4. What is the error in following code:

```
class Employee:
    # constructor
    def __init__(self, name, salary):
        # public data member
        self.name = name
        # private member
        self.__salary = salary

    #def print(self):
        #print(f"{self.name}-{self.__salary}")

#creating object of a class
emp = Employee('Jessa', 10000)
#emp.print()
#accessing private data members
print("Name:", emp.name)
print('Salary:', emp.__salary)
```

Q5. Modify above code to access private member outside of a class using an instance method.

Q6. The code for nested function is given as follows. Modify code to run following lines at end and tell the output.

Python program to illustrate nested functions

```
def outerFunction(text):  
    text = text  
    print(text)  
  
    def innerFunction():  
        print(text)
```

- a) Run innerFunction() from inside the outerFunction()
- b) Run innerFunction() from outside the outerFunction()

Q7. What is the difference when a program is written with lambda function and without lambda function.

Q8. You want to convert the string “ram sharma” to “Ram Sharma” using python code. Write the syntax for it.

Q9. What is output of the following program

```
class X:  
    def __init__(self, a):  
        self.num = a  
    def a1(self):  
        self.num *= 5
```

```
class Y(X):  
  
    def __init__(self, a):  
        X.__init__(self, a)  
  
    def a2(self):  
        self.num *= 6
```

```
obj1 = X(5)  
obj2 = Y(obj1)  
#obj2 = Y(5)  
print(obj1.num)  
obj1.a1()
```

```
print(obj1.num)
print(obj2.num)
obj2.a2()
print(obj2.num)
```

Q10. Predict the output:

- a. file1.txt=Hello! Welcome to the world of Python!

```
f = open("C:/Users/home/Desktop/Formatted/file1.txt",
"r")
print(f.read(7))
print(f.read(10))
```

- b. file2.txt=Delhi NCR has the worst pollution effects post Diwali.
Many schools have been closed and the online classes have started.

```
f = open("C:/Users/home/Desktop/Formatted/file2.txt",
"r")
print(f.readline)
```

Q12. Predict the outcome of the following:

```
def printDict():
    d=dict()

    for i in range(1,5):
        d[i]=i**2

    for (k,v) in d.items():
        print(k, v)

printDict()
```

Q13. Predict the outcome of the following:

```
x = lambda a, b: b if a <= 0 else 1 + x(a - 1, b)

print(x(9, 5))
```
